Smart Cradle System for Baby Monitoring

*Corresponding author: XXXXXXXX

ABSTRACT
On the planet, the at most consideration is required by little children. Infants need 24x7 minding by the guardians however now-a-days it is somewhat hard to guardians as they need to focus on parcel numerous things like house hold exercises, official works and individual works. To conquer this issue numerous analysts done an examination and accompanied a thought of "Programmed Cradle". This Automatic Cradle will take minds the child in the interest of their folks. All the Existing cradles are going to swing the baby in East-West direction which is not safe and a drawback. Our Project "Smart Cradle using IoT" will take cares the baby in three parameters and those parameters are temperature, urine and crying of a baby. In our project we use arduino UNO as a micro-controller and three sensors namely sound sensor, wet sensor and temperature sensor. After initialization of cradle all the sensors starts working. Whenever sound sensor detected that baby is crying, arduino makes cradle to swing in North-South direction that is from head to toe of a baby which will be helpful for better functioning of baby's body. This swinging mechanism is called as "weigen mechanism" which protects baby from dangerous brain injury. This project also helps in alerting the parents through alarm whenever the temperature sensor found that temperature of baby is abnormal. In the same way if urine is detected with the help of wet sensor then arduino will notify the parents by generating a sound using alarm so that by hearing that sound parents will take care of their baby. In above mentioned parameters "Smart Cradle using IoT" will be a care taker for their baby and helpful for present and future generations.

I. INTRODUCTION
As we all know the term IOT that is internet of things which is designed to save time and for making work easy and accurate. As far as time and security is concern with the help of IOT we will build a cradle system which will make parents stress free and most important it will be safe and secure for the baby. As we as a whole know the term IOT that is web of things which is intended to save time and for making work simple and precise. To the extent time and security is worry with the assistance of IOT we will assemble a support framework which will make guardians tranquil and most significant it will be free from any danger for the child. As we as a whole know the term IOT that is web of things which is intended to save time and for making work simple and precise. To the extent time and security is worry with the assistance of IOT we will assemble a support framework which will make guardians tranquil and most significant it will be free from any danger for the child. it doesn't make any difference if there is nobody to swing support it will do swing naturally if the child is crying. It doesn't make any difference if infant has done pee and no one thinks about for long time, yet not have to stress support framework will likewise give the caution about the wetness in support Also, if baby is getting fever or cold Cradle system also have the ability to detect it and send the alert. Our cradle will also able to detect if any motion in the cradle by motion sensor for security reason for the child. Proposed framework will help the guardians, with the goal that they can take great consideration of their child.

II. MOTIVATION
A significant number of IOT gadgets are being create in the IT area. There are a few supports likewise, which are worked with combination of IOT, yet there are some less element which could be danger to the soundness of the children As we have found in India or some other industrializing country that the two guardians need to go to work and furthermore take care of the child which increments responsibility on both the parent, it could likewise influence their proficient life and their children's life. Because of less highlighted support frameworks and guardians occupied timetable we are executing cutting edge support framework.

III. LITERATURE SURVEY
For dealing with the child there were a few babysitters who were getting paid for dealing with infant. There are a few infant medical services places additionally which takes cash and screen the child or sooth the infant. To the extent time passes there had been part of extortion recognized in these sorts of focuses from paper and news channels, we get the mindfulness about it There are a few supports likewise planned, however they
typically have just a couple of highlights. From that a couple highlights they itself were raising hell for dealing with infant or upsetting the infant from rest. Prior to finishing up to the framework that we need to fabricate, we studied a few papers and they are as per the following with issues that found: First paper is [2] "General Idea about Smart Baby Cradle" distributed in 2016. In this exploration paper creator express that support will swing naturally. Be that as it may, proposed framework was making an excessive amount of commotion of swing because of which child was getting upset from dozing. The framework had just one module and that was additionally prompting issue for child. Second paper is [3] "Advancement of an Intelligent Cradle for Home and Hospital Use" distributed in 2015. modules that was clearly acceptable

In this exploration paper creator expresses that framework is planned screen child development, bed-wet condition and internal heat level. Framework was giving three point. Be that as it may, there was nonattendance of one significant module of swinging support naturally. Third paper is [4] "An Automatic Monitoring and Swing the Child Cradle for Infant Care" distributed in 2015. In this research paper creator expresses that swing system has been framework was attempting to decide if child is protected or not. Along these lines, since utilization of Artificial insight cost of framework got expanded. Fourth paper is [1] "Savvy child support" was distributed in 2018. In this paper creator had given highlights like wetness discovery, support swing, camera observing, and so Yet, there was no office to quantify internal heat level of the child and room temperature of the infant.

PROPOSED SYSTEM

The chart is movement graph of the proposed framework. Movement chart expresses the total outline of the framework. Action chart starts and afterward there is a fork. There are five modules in support framework from which any one will be worked after any sort of circumstance that are given as follows:

If the baby is making noise or baby is crying then sound sensor will hear that frequency and it will start swing. Also, SMS alert will send to parent through the GSM module. If the baby had wetted the matrices of the cradle then alert SMS will send to the parent through the GSM module. If the body temperature of the baby changes rapidly with comparing atmosphere then alert SMS will send to the parents through GSM module. If baby is moving in cradle or any kind of movement detected by the PIR sensor then alert SMS will send to the parent through the GSM module.

ALGORITHM

Automatic cradle swing:
Cradle will start swinging the cradle when baby is crying, if is still crying for more than two minutes then it will send SMS to the parents.
Stage 1: Start
Stage 2: Check if child is crying
Stage 3: If sound distinguished at that point send SMS caution to the parent also, swing support.
Stage 4: If no solid identification at that point closes.

Wetness:
Infant's wetness can be distinguished by wet sensor. A wet sensor persistently continues checking whether the infant's bedding is wet or not. At the point when the wetness is detected at that point guardians are hinted by sending SMS. This framework helps in keeping the child in a Hygienic climate
Stage 1: Start
Stage 2: Check if Mattress is wet
Stage 3: If wetness is distinguished at that point send SMS alarm to the parent. Stage 4: If no wetness discovery at that point closes.

**Temperature:**
Temperature sensor helps in finding the internal heat level of the child. It checks the internal heat level of the child and sends SMS to guardians when temperature increments.  
Stage 1: Start  
Stage 2: Check if internal heat level changes quickly  
Stage 3: If temperature change distinguished at that point send SMS alert to the parent.  
Stage 4: If no temperature discovery at that point closes.

**PIR**
A movement location may distinguish moving items, especially individuals. For distinguishing an item PIR sensor is utilized. Here it plays out an undertaking like it checks the presence of infant in the support. The movement finder is basically utilized for security reason. It alarms the guardians when infant isn't found in the support, by sending SMS to guardians.  
Stage 1: Start  
Stage 2: Check if any movement in support.  
Stage 3: If movement recognized at that point send SMS caution to the parent.  
Stage 4: If no movement location at that point closes.
IV. CONCLUSION

Development of innovation has been quickly expanded. Since innovation has been grown incredibly it can add to the general public in different manner. Robotized support is the awesome model where working guardians have part of responsibility as of now and they need to mind of infant also. Support framework guarantees them that their infant is free from any and all harm inside the support. Support which is more affordable and safer and have more highlights. As strength of little child is consistently factor for which guardians are constantly stressed. So that support framework is worked for that reason that child will be better. This programmed child support would let the working mother to do family unit works other than dealing with infant at the equivalent time.
